

PYRAZOLE DERIVATIVES

This invention relates to the use of pyrazole derivatives in the manufacture of a reverse transcriptase inhibitor or modulator, to certain novel such pyrazole derivatives and to processes for the preparation of and compositions containing such novel derivatives.

5 The present pyrazole derivatives bind to the enzyme reverse transcriptase and are modulators, especially inhibitors thereof. Reverse transcriptase is implicated in the infectious lifecycle of HIV, and compounds which interfere with the function of this enzyme have shown utility in the treatment of conditions including AIDS. There is a constant need to provide new and better modulators, especially inhibitors, of HIV reverse transcriptase since the virus is  
10 able to mutate, becoming resistant to their effects.

The present pyrazole derivatives are useful in the treatment of a variety of disorders including those in which reverse transcriptase is implicated. Disorders of interest include those caused by Human Immunodeficiency Virus (HIV) and genetically related retroviruses, such as Acquired Immune Deficiency Syndrome (AIDS).

15 European Patent Application EP 0 786 455 A1 discloses a class of imidazole compounds which inhibit the growth of HIV. A class of N-phenylpyrazoles which act as reverse transcriptase inhibitors are disclosed in *J. Med. Chem.*, 2000, **43**, 1034. Antiviral activity is ascribed to a class of N-(hydroxyethyl)pyrazole derivatives in US patent number 3,303,200.

30 All of the compounds of the formula (I) and the compounds of the formula (Ib) can be prepared by conventional routes such as by the procedures described in the general methods presented below or by the specific methods described in the Examples section, or by similar methods thereto. The present invention also encompasses any one or more of these processes for preparing the compounds of formula (Ib).

35 In the following general methods, R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup> and X are as previously defined for a compound of the formula (Ib) or a compound of the formula (I) unless otherwise stated.

Compounds of the formula (Ib) and compounds of the formula (I) in which R<sup>1</sup> and R<sup>3</sup> are each either H, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>3</sub>-C<sub>7</sub> cycloalkyl, phenyl, benzyl, -CO<sub>2</sub>R<sup>5</sup>, -CONR<sup>5</sup>R<sup>5</sup>, or C-

linked  $R^6$ , optionally substituted where allowed, may be prepared by the reaction of a compound of the formula

with a compound of the formula

or a salt or hydrate thereof, optionally in the presence of an acid or a base, the base preferably being a tertiary amine base such as triethylamine and the acid preferably being acetic acid. In a typical procedure, a solution of the compound of the formula (II) in a suitable solvent, such as ethanol, is treated with the compound of the formula (III), or the salt or  
10 hydrate thereof, and, if used, the appropriate acid or base, at a temperature of from room temperature to the reflux temperature of the solvent. In a preferred procedure, the reaction mixture is heated under reflux.

Functional equivalents of compounds of the formula (II) may also be used in this reaction. These include compounds of the formula (IV) or (V), in which  $L^1$  and  $L^2$ , respectively,  
15 are each suitable leaving groups, preferably  $-N(C_1-C_6\text{ alkyl})_2$ , most preferably  $-N(CH_3)_2$ .

Thus, a compound of the formula (Ib) or a compound of the formula (I) may be prepared by the condensation of a compound of the formula (IV) or (V) with a compound of the formula (III), or a salt or hydrate thereof, optionally in the presence of an acid or a base, the base preferably being a tertiary amine base such as triethylamine and the acid preferably being acetic acid. In a typical procedure, a solution of the compound of the formula (IV) or (V) in a suitable solvent, such as acetic acid, is treated with the compound of the formula (III), or the salt or hydrate thereof, and, if used, the appropriate acid or base, at a temperature of from  
20 room temperature to the reflux temperature of the solvent. In a preferred procedure, the reaction mixture is heated under reflux. Compounds of the formula (IV) or (V) are particularly suitable for the synthesis of compounds of the formula (Ib) or compounds of the formula (I) in which  $R^1$  or  $R^3$ , respectively, is H.

Compounds of the formula (IV) in which  $R^1$  is H and  $L^1$  is dimethylamino may be prepared by the reaction of a compound of the formula (VI) with dimethylformamide dimethylacetal at an elevated temperature, preferably at about 100°C. Compounds of the formula (V) in which  $R^3$  is H and  $L^2$  is dimethylamino may be prepared by the reaction of a compound of the formula (VII) under the same conditions. Other compounds of the formula (IV) or (V) in which  $L^1$  or  $L^2$  is dimethylamino may be prepared analogously.

Compounds of the formula (VI) are either commercially available or may be prepared

(VI)

(VII)

10 by methods well known in the art. For example, where X is S, compounds of the formula (VI) may be prepared by the reaction of a compound of the formula

with a compound of the formula

15 In a typical procedure a solution of a compound of the formula (VIII) in a suitable solvent, such as acetone, is treated with a compound of the formula (IX), optionally treated with a base, such as potassium carbonate and optionally treated with a catalyst such as sodium iodide or tetrabutylammonium iodide. The reaction is preferably performed at room temperature.

20 Compounds of the formula (VII) are either commercially available or may be prepared  
from a compound of the formula

and a compound of the formula (IX) in the same way that a compound of the formula (VI) may be prepared from a compound of the formula (VIII).

25 Compounds of the formula (II) may be prepared using the route shown in Scheme 1  
 in which  $L^3$  is a suitable leaving group, preferably chloro.

Scheme 1

In Scheme 1, compounds of the formula (II) in which X is  $-\text{CH}_2-$  may be prepared by 5 the reduction of a compound of the formula (XI) with a suitable reducing agent such as (a) hydrogen in the presence of a palladium catalyst, (b) diphenylsilane in the presence of a palladium catalyst and a zinc salt or (c) triethylsilane in the presence of an acid such as trifluoroacetic acid. In a typical procedure, a solution of the compound of the formula (XI) in a suitable solvent, such as ethanol or a mixture of ethanol and ethyl acetate, under a hydrogen 10 atmosphere, is treated with 5% w/w palladium on barium sulphate. In another typical procedure, a solution of the compound of the formula (XI) in a suitable solvent, such as dichloromethane, is treated with diphenylsilane, tetrakis(triphenylphosphine)palladium (0) and zinc chloride. In a further typical example, a solution of the compound of the formula (XI) in a suitable solvent, such as dichloromethane, is treated with triethylsilane and trifluoroacetic acid. 15

Compounds of the formula (XI) may be prepared by the condensation of a compound of the formula (XII) with a compound of the formula

or a functional equivalent thereof, such as an acetal, optionally in the presence of a 20 suitable catalyst, such as a mixture of acetic acid and piperidine. In a typical procedure, a solution of the compound of the formula (XII) in a suitable solvent such as toluene is treated

with a compound of the formula (XV), acetic acid and piperidine and heated at a temperature of from room temperature to the reflux temperature of the solvent. Preferably, the reaction mixture is heated under reflux using a Dean-Stark apparatus. Compounds of the formula (XI), prepared in this way, in which  $R^1$  and  $R^3$  are different, are usually formed as a mixture of 5 stereoisomers. Such a mixture may be used directly in subsequent transformations or separated into its individual stereoisomers which may then be used separately.

Alternatively, compounds of the formula (II) in which X is  $-CH_2-$  may be prepared by the reaction of a compound of the formula (XII) with a compound of the formula

10 in which  $L^6$  is a suitable leaving group, preferably is chloro, bromo, iodo or para-toluenesulphonate, in the presence of a suitable base. In a typical procedure, a solution of the compound of the formula (XII) in a suitable solvent, such as 2-butanone, tetrahydrofuran, acetonitrile or diethylether, is treated with a base, such as sodium ethoxide, sodium hydride or sodium carbonate, and the compound of the formula (XXVIII), optionally with heating. A 15 preferred combination is 2-butanone as the solvent and sodium hydride as the base.

Compounds of the formula (XII) and compounds of the formula (XXVIII) are either commercially available or are easily prepared by methods well known to the skilled person.

Compounds of the formula (II) in which X is  $-CHR^{10}-$  (other than where  $R^{10}$  is  $C_1-C_6$  alkoxy - see below for the preparation of these compounds) may be prepared by the reduction 20 of a compound of the formula (XIII) with a suitable reducing agent such as (a) hydrogen in the presence of a palladium catalyst, (b) diphenylsilane in the presence of a palladium catalyst and a zinc salt or (c) triethylsilane in the presence of an acid such as trifluoroacetic acid. In a typical procedure, a solution of the compound of the formula (XIII) in a suitable solvent, such as ethanol or a mixture of ethanol and ethyl acetate, under a hydrogen atmosphere, is treated 25 with 5% w/w palladium on barium sulphate. In another typical procedure, a solution of the compound of the formula (XIII) in a suitable solvent, such as dichloromethane, is treated with diphenylsilane, tetrakis(triphenylphosphine)palladium (0) and zinc chloride. In a further typical example, a solution of the compound of the formula (XIII) in a suitable solvent, such as dichloromethane, is treated with triethylsilane and trifluoroacetic acid.

30 Compounds of the formula (XIII) may be prepared by the condensation of a compound of the formula (XII) with a compound of the formula

or a functional equivalent thereof, such as a ketal, optionally in the presence of a suitable catalyst, such as a mixture of acetic acid and piperidine. In a typical procedure, a 35 solution of the compound of the formula (XII) in a suitable solvent such as toluene is treated with a compound of the formula (XVI), acetic acid and piperidine and heated at a temperature of from room temperature to the reflux temperature of the solvent. Preferably, the reaction

mixture is heated under reflux using a Dean-Stark apparatus. Compounds of the formula (XIII), prepared in this way, in which  $R^1$  and  $R^3$  are different, are usually formed as a mixture of stereoisomers. Such a mixture may be used directly in subsequent transformations or separated into its individual stereoisomers which may then be used separately.

5 Compounds of the formula (II) in which X is -S- may be prepared by the reaction of a compound of the formula (XIV) with a compound of the formula (IX). In a typical procedure a solution of a compound of the formula (XIV) in a suitable solvent, such as acetone, is treated with a compound of the formula (IX), optionally treated with a base, such as potassium carbonate and optionally treated with a catalyst such as sodium iodide or tetrabutylammonium 10 iodide. The reaction is preferably performed at room temperature.

Compounds of the formula (XIV) may be prepared by the reaction of a compound of the formula (XII) with a suitable activating agent, e.g. in the case where  $L^3$  is chloro, with a chlorinating agent such as sulphuryl chloride. In a typical procedure, where  $L^3$  is chloro, the compound of the formula (XII) is treated with sulphuryl chloride, optionally in the presence of 15 a suitable solvent such as dichloromethane.

Compounds of the formula (Ib) and compounds of the formula (I) in which  $R^1$  or  $R^3$  is -OR<sup>7</sup> may be prepared using the route shown in Scheme 2 in which R<sup>a</sup> is C<sub>1</sub>-C<sub>6</sub> alkyl and L<sup>4</sup> is a suitable leaving group, preferably trifluoromethanesulphonate.

Scheme 2

In Scheme 2, compounds of the formula (Ib) and compounds of the formula (I) in  
5 which  $\text{R}^1$  is  $-\text{OR}^7$  may be prepared by the reaction of a compound of the formula (XVII) with  
an alcohol of the formula

in the presence of a suitable catalyst, preferably a palladium catalyst, and carbon monoxide. In a typical procedure a mixture of the compound of the formula (XVII), a suitable palladium catalyst such as 1,1'-bis(diphenylphosphino)ferrocenepalladium(II)chloride, the alcohol of the formula (XXV) and, optionally, a suitable solvent such as N,N-dimethylformamide is heated, preferably to about 50°C, under an atmosphere of carbon monoxide, preferably at a pressure of 345 kPa.

Compounds of the formula (XVII) may be prepared by the derivatisation of a compound of the formula (XVIII). In the case where  $L^4$  is trifluoromethanesulphonate a suitable derivatising agent is phenyltriflame. In a typical procedure, where  $L^4$  is trifluoromethanesulphonate, a solution of the compound of the formula (XVIII) and a suitable base, preferably a trialkylamine base such as triethylamine, in a suitable solvent such as dichloromethane is treated with phenyltriflame.

Compounds of the formula (XVIII) may be prepared by the reaction of a compound of the formula (XIX) with a compound of the formula (III), or a salt or hydrate thereof, optionally in the presence of an acid or a base, the base preferably being a tertiary amine base such as triethylamine and the acid preferably being acetic acid. In a typical procedure, a solution of the compound of the formula (XIX) in a suitable solvent, such as ethanol, is treated with the compound of the formula (III), or the salt or hydrate thereof, and, if used, the appropriate acid or base, at a temperature of from room temperature to the reflux temperature of the solvent.

In a preferred procedure, the reaction mixture is heated under reflux.

Compounds of the formula (XIX) may be prepared by the derivatisation of a compound of the formula (XX) in the same way that compounds of the formula (II) may be prepared by the derivatisation of a compound of the formula (XII) as described above.

Compounds of the formula (XX) are either commercially available or are readily prepared by methods well known to the skilled person.

In Scheme 2, compounds of the formula (Ib) and compounds of the formula (I) in which  $R^3$  is  $-OR^7$  may be prepared from a compound of the formula (XXIV) in the same way that a compound of the formula (I) or a compound of the formula (Ib) in which  $R^1$  is  $-OR^7$  is prepared from a compound of the formula (XX), as described above, *mutatis mutandis*.

The skilled man will appreciate that compounds of the formula (XVIII) and compounds of the formula (XXII) may exist in one of several tautomeric forms.

Alternatively, compounds of the formula (Ib) and compounds of the formula (I) in which  $R^1$  or  $R^3$  is  $-OR^7$  may be prepared from compounds of the formula (XVIII) or (XXII), respectively, by reaction with a compound of the formula (XXV) under dehydrating conditions, e.g. using the Mitsunobu reaction. In a typical procedure, a solution of the compound of the formula (XVIII) or (XXII) in a suitable solvent, such as tetrahydrofuran is treated with a

dialkylazodicarboxylate, preferably diethylazodicarboxylate, a triarylphosphine, preferably triphenylphosphine and a compound of the formula (XXV).

Alternatively, compounds of the formula (Ib) and compounds of the formula (I) in which R<sup>1</sup> or R<sup>3</sup> is -OR<sup>7</sup> may be prepared from compounds of the formula (XVIII) or (XXII),

5 respectively, by reaction with a compound of the formula

in which L<sup>7</sup> is a suitable leaving group, preferably halo, optionally in the presence of a suitable base. In a typical procedure, a solution of the compound of the formula (XVIII) or the compound of the formula (XXII) in a suitable solvent, such as tetrahydrofuran, 10 dimethylformamide or ethanol, is treated with a base, such as sodium ethoxide or sodium carbonate, and the compound of the formula (XXIX), optionally with heating.

Compounds of the formula (Ib) and compounds of the formula (I) in which R<sup>1</sup> or R<sup>3</sup> is halo may be prepared by the reaction, respectively, of a compound of the formula (XVIII) or a compound of the formula (XXII) with a suitable halogenating agent. In a typical procedure, the compound of the formula (XVIII) or (XXII) is treated with POCl<sub>3</sub>, optionally in the presence of a suitable solvent such as dimethylformamide, to give a compound of the formula (Ib) or a compound of the formula (I) in which R<sup>1</sup> or R<sup>3</sup>, respectively, is chloro.

Compounds of the formula (Ib) and compounds of the formula (I) in which R<sup>1</sup> or R<sup>3</sup> is -OCONR<sup>5</sup>R<sup>5</sup> may be prepared by the reaction, respectively, of a compound of the formula (XVIII) or a compound of the formula (XXII) with a compound of the formula

in which L<sup>5</sup> is a suitable leaving group, preferably chloro, or, in the case where one of the R<sup>5</sup> groups is H, with a compound of the formula

25 Compounds of the formula (Ib) and compounds of the formula (I) in which R<sup>1</sup> or R<sup>3</sup> is -NH<sub>2</sub> may be prepared by the route shown in Scheme 3.

Scheme 3

5        In Scheme 3, compounds of the formula (Ib) and compounds of the formula (I) in which  $\text{R}^1$  is  $-\text{NH}_2$  may be prepared by the reaction of a compound of the formula (XXX) with a compound of the formula (III), or a salt or hydrate thereof, optionally in the presence of an acid or a base, the base preferably being a tertiary amine base such as triethylamine and the acid preferably being acetic acid. In a typical procedure, a solution of the compound of the  
10      formula (XXX) in a suitable solvent, such as ethanol, is treated with the compound of the formula (III), or the salt or hydrate thereof, and, if used, the appropriate acid or base, at a temperature of from room temperature to the reflux temperature of the solvent. In a preferred procedure, the reaction mixture is heated under reflux.

Compounds of the formula (XXX) may be prepared from a compound of the formula (XXXI) in the same way that compounds of the formula (II) may be prepared from a compound of the formula (XII) as described above.

Compounds of the formula (XXXI) are either commercially available or readily prepared by methods well known to the skilled person.

20      In Scheme 3, compounds of the formula (Ib) and compounds of the formula (I) in which  $\text{R}^3$  is  $-\text{NH}_2$  may be prepared from a compound of the formula (XXXIII) in the same way that compounds of the formula (Ib) and compounds of the formula (I) in which  $\text{R}^1$  is  $\text{NH}_2$  may be prepared from compounds of the formula (XXXI), *mutatis mutandis*.

Compounds of the formula (Ib) and compounds of the formula (I) in which X is -CO- or -CHR<sup>10</sup>- and R<sup>10</sup> is C<sub>1</sub>-C<sub>6</sub> alkoxy may be prepared by the route shown in Scheme 4 in which R<sup>b</sup> is C<sub>1</sub>-C<sub>6</sub> alkyl.

5

Scheme 4

In Scheme 4, compounds of the formula (Ib) and compounds of the formula (I) in which X is -CO- (i.e. compounds of the formula (Ic)) may be prepared by the oxidation of a compound of the formula (XXXIV). In a typical procedure, a solution of a compound of the formula (XXXIV) in a suitable solvent, such as dichloromethane, is treated with N-methylmorpholine-N-oxide and tetra-n-propylammonium perruthenate<sup>(VII)</sup>.

Compounds of the formula (Ib) and compounds of the formula (I) in which X is -CHR<sup>10</sup>- and R<sup>10</sup> is C<sub>1</sub>-C<sub>6</sub> alkoxy (i.e. compounds of the formula (Id)) may be prepared by the alkylation of a compound of the formula (XXXIV). In a typical procedure, a solution of a

compound of the formula (XXXIV) in a suitable solvent, such as N,N-dimethylformamide, is treated with a base, such as sodium hydride, and a compound of the formula

wherein  $R^b$  is  $C_1$ - $C_6$  alkyl and  $L^8$  is a suitable leaving group, preferably chloro, bromo or iodo.

Compounds of the formula (XXXIV) may be prepared by the reaction of a compound of the formula (XXXV) with a suitable metal or organometallic reagent to form an organometallic intermediate which is reacted with a compound of the formula (XV). A preferred metal is magnesium. In a typical procedure, a solution of the compound of the formula (XXXV) in a suitable solvent, such as tetrahydrofuran, is treated with an alkylmagnesium chloride, e.g. iso-propylmagnesium chloride, preferably with cooling in an ice bath, and a compound of the formula (XV) is added.

Compounds of the formula (XXXV) may be prepared by the reaction of a compound of the formula (XXXVI) with a suitable base, preferably sodium hydride, and the addition of a compound of the formula

wherein  $L^9$  is a suitable leaving group, preferably a chloro, bromo, iodo or tosylate group. In a typical procedure, a solution of the compound of the formula (XXXVI) in a suitable solvent, such as N,N-dimethylformamide, is treated firstly with a suitable base, such as sodium hydride, and then with a compound of the formula (XXXIX). The reaction is then preferably heated, most preferably to 50°C. If  $R^2$  contains a free -OH, -NH<sub>2</sub>, or -NH- group then a protecting group is preferably employed to mask such functionality. Examples of suitable protecting groups will be apparent to the skilled person [see, for instance, 'Protecting groups in Organic Synthesis (Second Edition)' by Theodora W. Green and Peter G. M. Wuts, 1991, John Wiley and Sons]. The protecting group may be removed immediately or carried through subsequent steps, as described above, and removed as a final step (see below).

Compounds of the formula (XXXVI) may be prepared by the reaction of a compound of the formula (XXXVII) with a suitable iodinating agent. In a typical procedure, a solution of the compound of the formula (XXXVII) in a suitable solvent, such as dichloromethane, is treated with the iodinating agent which is preferably N-iodosuccinimide.

Compounds of the formula (XXXVII) are either commercially available or are readily prepared by methods well known to the skilled man. Such compounds may, for instance, be prepared by analogy with the methods presented above, for example by the reaction of a diketone (XII) with a compound of the formula (III), or a salt or solvate thereof.

It will be appreciated by those skilled in the art that, in many cases, compounds of the formula (Ib) and compounds of the formula (I) may be converted, respectively, into other

compounds of the formula (Ib) or compounds of the formula (I) by functional group transformations. For instance:

(a) Compounds of the formula (Ib)/(I) in which  $R^2$  is H may be converted into compounds of the formula (Ib)/(I) in which  $R^2$  is optionally substituted  $C_1$ - $C_6$  alkyl by reaction 5 with an appropriate alkylating agent. In a typical procedure, a solution of a compound of the formula (Ib)/(I) in which  $R^2$  is H in a suitable solvent such as ethanol or  $N,N$ -dimethylformamide is treated with an alkyl bromide and a base such as sodium ethoxide or sodium hydride and heated at a temperature of from room temperature to the reflux 10 temperature of the solvent. A preferred combination is  $N,N$ -dimethylformamide as the solvent, sodium hydride as the base and room temperature as the temperature. Examples of specific alkylating agents include bromoacetonitrile, ethyl 4-chloroacetoacetate, ethyl bromoacetate, methyl bromoacetate and chloroethylamine hydrochloride. The use of further specific alkylating agents is illustrated by the Examples below.

(b) Compounds of the formula (Ib)/(I) in which  $R^2$  contains an ester functionality 15 may be reduced with a suitable reducing agent, such as lithium aluminium hydride, to give corresponding compounds of the formula (Ib)/(I) in which  $R^2$  contains a hydroxy group. In a typical procedure, a solution of the compound of the formula (Ib)/(I), in which  $R^2$  contains an ester group, in a suitable solvent, such as diethyl ether, is treated with lithium aluminium hydride, preferably with cooling to a temperature of from -78 °C to 0 °C.

(c) Compounds of the formula (Ib)/(I) in which  $R^1$  or  $R^3$  is -NH<sub>2</sub>, may be 20 converted into compounds of the formula (Ib)/(I) in which  $R^1$  or  $R^3$ , respectively, is -NHR<sup>c</sup>, where  $R^c$  is  $C_1$ - $C_6$  alkyl,  $C_3$ - $C_8$  cycloalkyl or benzyl by a reductive amination with an appropriate aldehyde or ketone. In a typical reductive amination, the reaction will proceed in a suitable solvent such as dichloromethane, in the presence of a suitable reducing agent such 25 as sodium triacetoxyborohydride and optionally in the presence of an acid such as acetic acid. A further reductive amination may be performed on a compound of the formula (Ib)/(I) in which  $R^1$  or  $R^3$  is -NHR<sup>c</sup> to give a compound of the formula (Ib)/(I) in which  $R^1$  or  $R^3$ , respectively, is -NR<sup>c</sup>R<sup>c</sup>, where  $R^c$  is as defined above and each  $R^c$  may be the same or different.

(d) Compounds of the formula (Ib)/(I) in which  $R^1$  or  $R^3$  is -NHR<sup>5</sup>, may be 30 converted into compounds of the formula (Ib)/(I) in which, respectively,  $R^1$  is -NR<sup>5</sup>COR<sup>5</sup>, -NR<sup>5</sup>CONR<sup>5</sup>R<sup>5</sup>, -NR<sup>5</sup>CO<sub>2</sub>R<sup>7</sup> or -NR<sup>5</sup>SO<sub>2</sub>R<sup>7</sup> or  $R^3$  is -NR<sup>5</sup>COR<sup>5</sup>, -NR<sup>5</sup>CONR<sup>5</sup>R<sup>5</sup>, -NR<sup>5</sup>CO<sub>2</sub>R<sup>7</sup> or -NR<sup>5</sup>SO<sub>2</sub>R<sup>7</sup> by reaction with an appropriate acylating or sulphonylating agent in a suitable inert solvent, such as dichloromethane, optionally in the presence of a base, preferably a tertiary amine base such as triethylamine.

(e) Compounds of the formula (Ib)/(I) in which  $R^1$  or  $R^3$  is -CO<sub>2</sub>R<sup>5</sup>, wherein  $R^5$  is 35 other than H, may be converted into compounds of the formula (Ib)/(I) in which  $R^1$  or  $R^3$ ,

respectively, is  $-\text{CO}_2\text{H}$  by hydrolysis. Typically the reaction will be carried out in a suitable solvent, such as aqueous ethanol, or aqueous 1,4-dioxan and in the presence of a base such as sodium hydroxide. Such an acid may be converted to a primary amide by reaction with ammonia and a suitable coupling agent, such as a carbodiimide, e.g. 5 dicyclohexylcarbodiimide. Such a primary amide may then be converted into a nitrile by dehydration with a suitable dehydrating agent, such as phosphoryl chloride.

10 (f) Compounds of the formula (Ib)/(I) in which  $\text{R}^1$  or  $\text{R}^3$  is  $-\text{CO}_2\text{H}$ , may be converted into compounds of the formula (Ib)/(I) in which  $\text{R}^1$  or  $\text{R}^3$ , respectively, is  $-\text{NH}_2$ , by the Curtius rearrangement. In a typical procedure, the reaction is carried out in a suitable solvent, such as dichloromethane, in the presence of a reagent such as diphenylphosphoryl azide.

15 (g) Compounds of the formula (Ib)/(I) in which  $\text{X}$  is  $-\text{S}-$  may be converted into compounds of the formula (Ib)/(I) in which  $\text{X}$  is  $-\text{SO}-$  by reaction with a suitable oxidising agent, such as meta-chloroperoxybenzoic acid. The reaction is carried out in the presence of a suitable solvent such as dichloromethane.

20 (h) Compounds of the formula (Ib)/(I) in which  $\text{X}$  is  $-\text{S}-$  may be converted into compounds of the formula (Ib)/(I) in which  $\text{X}$  is  $-\text{SO}_2-$  by reaction with a suitable oxidising agent such as Oxone (trade mark), meta-chloroperoxybenzoic acid or hydrogen peroxide. In a typical procedure, a solution of the compound of the formula (Ib)/(I) in which  $\text{X}$  is  $-\text{S}-$  in a suitable solvent, such as dichloromethane, is treated with meta-chloroperoxybenzoic acid.

25 (i) Compounds of the formula (Ib)/(I) in which  $\text{R}^1$ ,  $\text{R}^2$  or  $\text{R}^3$  contain a heterocycle of the formula  $\text{R}^6$  may be prepared by standard heterocycle-forming reactions well known to the skilled person (see, for example, Advanced Organic Chemistry, 3rd Edition, by Gerry March or Comprehensive Heterocyclic Chemistry, A.R. Katritzky, C.W. Rees, E.F.V. Scriven, Volumes 1-11), either from another compound of the formula (Ib)/(I) or otherwise. For instance, compounds of the formula (Ib)/(I) in which  $\text{R}^2$  is (2-amino-6-hydroxypyrimidin-4-yl)methyl may be prepared by the sequential reaction of a compound of the formula (Ib)/(I) in which  $\text{R}^2$  is H with methyl 4-chloroacetoacetate and then guanidine hydrochloride.

30 (j) Compounds of the formula (Ib)/(I) in which either  $\text{R}^1$  or  $\text{R}^3$  is an N-linked heterocycle of the formula  $\text{R}^6$  may be prepared from compounds of the formula (Ib)/(I) in which  $\text{R}^1$  or  $\text{R}^3$ , respectively, is  $-\text{NH}_2$ , by standard heterocycle-forming reactions well known to the skilled man (see, for example, Advanced Organic Chemistry, 3rd Edition, by Gerry March or Comprehensive Heterocyclic Chemistry, A.R. Katritzky, C.W. Rees, E.F.V. Scriven, Volumes 1-11).

35 Compounds of the formula (Ib)/(I) containing an  $-\text{OH}$ ,  $-\text{NH}-$  or  $-\text{NH}_2$  group may be prepared by the deprotection of the corresponding compound bearing an  $-\text{OP}^1$ ,  $-\text{NP}^1-$  or  $-\text{NHP}^1$  group, respectively, wherein the group  $\text{P}^1$  is a suitable protecting group. Examples of suitable protecting groups will be apparent to the skilled person [see, for instance, 'Protecting

groups in Organic Synthesis (Second Edition)' by Theodora W. Green and Peter G. M. Wuts, 1991, John Wiley and Sons]. Such compounds bearing an -OP<sup>1</sup>, -NP<sup>1</sup>- or -NHP<sup>1</sup> group may be prepared using the routes described above, *mutatis mutandis*.

5 The compounds of the formula (I) and the compounds of the formula (Ib) can be administered alone but will generally be administered in admixture with a suitable pharmaceutical excipient, diluent or carrier selected with regard to the intended route of administration and standard pharmaceutical practice.

10 For example, the compounds of the formula (I) and the compounds of the formula (Ib) can be administered orally, buccally or sublingually in the form of tablets, capsules, multi-particulates, gels, films, ovules, elixirs, solutions or suspensions, which may contain flavouring or colouring agents, for immediate-, delayed-, modified-, sustained-, pulsed- or controlled-release applications. The compounds of the formula (I) and the compounds of the formula (Ib) may also be administered as fast-dispersing or fast-dissolving dosage forms or in the form of a high energy dispersion or as coated particles. Suitable formulations of the 15 compounds of the formula (I) and the compounds of the formula (Ib) may be in coated or uncoated form, as desired.

20 Such solid pharmaceutical compositions, for example, tablets, may contain excipients such as microcrystalline cellulose, lactose, sodium citrate, calcium carbonate, dibasic calcium phosphate, glycine and starch (preferably corn, potato or tapioca starch), disintegrants such as sodium starch glycollate, croscarmellose sodium and certain complex silicates, and granulation binders such as polyvinylpyrrolidone, hydroxypropylmethylcellulose (HPMC), hydroxypropylcellulose (HPC), sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, stearic acid, glyceryl behenate and talc may be included.

General Example

25 A formulation of the tablet could typically contain between about 0.01mg and 500mg of active compound whilst tablet fill weights may range from 50mg to 1000mg. An example of a formulation for a 10mg tablet is illustrated below:

<u>Ingredient</u>	<u>%w/w</u>
Compound of the formula (I)/(Ib) or salt	10.000*
Lactose	64.125
Starch	21.375
Croscarmellose sodium	3.000
Magnesium Stearate	1.500

35 \* Quantity adjusted in accordance with drug activity.

The tablets are manufactured by a standard process, for example, direct compression or a wet or dry granulation process. The tablet cores may be coated with appropriate overcoats.

Solid compositions of a similar type may also be employed as fillers in gelatin or 5 HPMC capsules. Preferred excipients in this regard include lactose, starch, a cellulose, milk sugar or high molecular weight polyethylene glycols. For aqueous suspensions and/or elixirs, the compounds of the formula (I) and the compounds of the formula (Ib) may be combined with various sweetening or flavouring agents, colouring matter or dyes, with emulsifying and/or suspending agents and with diluents such as water, ethanol, propylene glycol and 10 glycerin, and combinations thereof.

The compounds of the formula (I) and the compounds of the formula (Ib) can also be administered parenterally, for example, intravenously, intra-arterially, intraperitoneally, intrathecally, intraventricularly, intraurethrally, intrasternally, intracranially, intramuscularly or subcutaneously, or they may be administered by infusion or needleless injection techniques. 15 For such parenteral administration they are best used in the form of a sterile aqueous solution which may contain other substances, for example, enough salts or glucose to make the solution isotonic with blood. The aqueous solutions should be suitably buffered (preferably to a pH of from 3 to 9), if necessary. The preparation of suitable parenteral formulations under sterile conditions is readily accomplished by standard pharmaceutical techniques well-known 20 to those skilled in the art.

For oral and parenteral administration to human patients, the daily dosage level of the compounds of the formula (I) and the compounds of the formula (Ib) will usually be from 0.01 to 30 mg/kg, preferably from 0.01 to 10 mg/kg (in single or divided doses).

Thus tablets or capsules of the compound of the formula (I) or the compound of the 25 formula (Ib) may contain from 1 to 500 mg of active compound for administration singly or two or more at a time, as appropriate. The physician in any event will determine the actual dosage which will be most suitable for any individual patient and it will vary with the age, weight and response of the particular patient. The above dosages are exemplary of the average case. There can, of course, be individual instances where higher or lower dosage 30 ranges are merited and such are within the scope of this invention. The skilled person will appreciate that, in the treatment of certain conditions the compounds of the formula (I) and the compounds of the formula (Ib) may be taken as a single dose as needed or desired.

The compounds of formula (I) and the compounds of the formula (Ib) can also be administered intranasally or by inhalation and are conveniently delivered in the form of a dry 35 powder inhaler or an aerosol spray presentation from a pressurised container, pump, spray, atomiser or nebuliser, with or without the use of a suitable propellant, e.g. dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, a

hydrofluoroalkane such as 1,1,1,2-tetrafluoroethane (HFA 134A [trade mark]) or 1,1,1,2,3,3,3-heptafluoropropane (HFA 227EA [trade mark]), carbon dioxide or other suitable gas. In the case of a pressurised aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount. The pressurised container, pump, spray, atomiser or nebuliser

5 may contain a solution or suspension of the active compound, e.g. using a mixture of ethanol and the propellant as the solvent, which may additionally contain a lubricant, e.g. sorbitan trioleate. Capsules and cartridges (made, for example, from gelatin) for use in an inhaler or insufflator may be formulated to contain a powder mix of a compound of the formula (I) or a compound of the formula (Ib) and a suitable powder base such as lactose or starch.

10 Alternatively, the compounds of the formula (I) and the compounds of the formula (Ib) can be administered in the form of a suppository or pessary, or they may be applied topically in the form of a gel, hydrogel, lotion, solution, cream, ointment or dusting powder. The compounds of the formula (I) and the compounds of the formula (Ib) may also be dermally or transdermally administered, for example, by the use of a skin patch. They may also be

15 administered by the pulmonary or rectal routes.

They may also be administered by the ocular route. For ophthalmic use, the compounds can be formulated as micronised suspensions in isotonic, pH adjusted, sterile saline, or, preferably, as solutions in isotonic, pH adjusted, sterile saline, optionally in combination with a preservative such as a benzylalkonium chloride. Alternatively, they may

20 be formulated in an ointment such as petrolatum.

For application topically to the skin, the compounds of the formula (I) and the compounds of the formula (Ib) can be formulated as a suitable ointment containing the active compound suspended or dissolved in, for example, a mixture with one or more of the following: mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene

25 polyoxypropylene compound, emulsifying wax and water. Alternatively, they can be formulated as a suitable lotion or cream, suspended or dissolved in, for example, a mixture of one or more of the following: mineral oil, sorbitan monostearate, a polyethylene glycol, liquid paraffin, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

30 The compounds of the formula (I) and the compounds of the formula (Ib) may also be used in combination with a cyclodextrin. Cyclodextrins are known to form inclusion and non-inclusion complexes with drug molecules. Formation of a drug-cyclodextrin complex may modify the solubility, dissolution rate, bioavailability and/or stability of a drug molecule. Drug-cyclodextrin complexes are generally useful for most dosage forms and administration routes.

35 As an alternative to direct complexation with the drug the cyclodextrin may be used as an auxiliary additive, e.g. as a carrier, diluent or solubiliser. Alpha-, beta- and gamma-

cyclodextrins are most commonly used and suitable examples are described in WO-A-91/11172, WO-A-94/02518 and WO-A-98/55148.

It is to be appreciated that all references herein to treatment include curative, palliative and prophylactic treatment.

5       Oral administration is preferred.

Included within the scope of the present invention are embodiments comprising the co-administration of a compound of the present invention with one or more additional therapeutic agents, and compositions containing a compound of the present invention along with one or more additional therapeutic agents. Such a combination therapy is especially 10 useful for the treatment of infection by HIV and related retroviruses which may evolve rapidly into strains resistant to any monotherapy. Alternatively, additional therapeutic agents may be desirable to treat diseases and conditions which result from or accompany the disease being treated with the compound of the present invention. For example, in the treatment of an HIV 15 or related retroviral infection, it may be desirable to additionally treat opportunistic infections, neoplasms and other conditions which occur as a result of the immuno-compromised state of the patient being treated.

Preferred combinations of the present invention include simultaneous or sequential treatment with a compound of the formula (I) or a compound of the formula (Ib), as defined above, or a pharmaceutically acceptable salt thereof, and:

20       (a)     one or more reverse transcriptase inhibitors such as zidovudine, didanosine, zalcitabine, stavudine, lamivudine, abacavir, adefovir, combivir or trizivir;

      (b)     one or more non-nucleoside reverse transcriptase inhibitors such as nevirapine, delavirdine or efavirenz;

25       (c)     one or more HIV protease inhibitors such as indanivir, ritonavir, saquinavir or nelfinavir;

      (d)     one or more CCR5 antagonists such as TAK-779 or SCH-351125;

      (e)     one or more CXCR4 antagonists such as AMD-3100;

      (f)     one or more integrase inhibitors;

      (g)     one or more inhibitors of viral fusion such as T-20 or T-1249;

30       (h)     one or more investigational drugs such as KNI-272, amprenavir, GW-33908, FTC, PMPA, S-1153, MKC-442, MSC-204, MSH-372, DMP450, PNU-140690, ABT-378, KNI-764, DPC-083, TMC-120 or TMC-125; or

      (i)     one or more antifungal or antibacterial agents such as fluconazole.

The activity of the compounds of the invention as reverse transcriptase inhibitors and 35 as agents for treating HIV infections may be measured using the following assays.

A. Inhibition of HIV-1 reverse transcriptase enzyme

The reverse transcriptase activity of the compounds of the invention may be assayed as following. Using the purified recombinant HIV-1 reverse transcriptase (RT, EC, 2.7.7.49) obtained by expression in Escherichia Coli, a 96-well plate assay system was established for 5 assaying a large number of samples using either the Poly(rA)-oligo(dT) Reverse Transcriptase [3H]-SPA enzyme assay system (Amersham NK9020) or the [3H]-flashplate enzyme assay system (NEN - SMP 103) and following the manufacturer's recommendations. The compounds were dissolved in 100% DMSO and diluted with the appropriate buffer to a 5% final DMSO concentration. The inhibitory activity was expressed in percent inhibition 10 relative to the DMSO control. The concentration at which the compound inhibited the reverse transcriptase by 50% was expressed as the IC<sub>50</sub> of the compound.

B. Anti-Human Immunodeficiency Virus (HIV-1) cell culture assay

The anti-HIV activity of the compounds of the invention may be assayed by the following procedures.

- 15 1) SupT1 cells were cultured in an RPMI-1640 medium supplemented with 10% foetal calf serum and were split so that they were in growth phase on the day of use.
- 2) The compounds were dissolved in 100% DMSO and diluted with the above culture medium to predetermined concentrations and distributed in 20 $\mu$ l aliquots into a 96-well microtiter plate (0.1% DMSO final concentration).
- 20 3) To prepare infected cells, 100 $\mu$ l of RF viruses (TCID<sub>50</sub> of 10<sup>7</sup>/ml) were added to 10<sup>6</sup> cells and incubated for 1 hour at 37°C. The cells were then washed twice in PBS and resuspended in the culture medium at a density of 2.2 x 10<sup>5</sup> cells/ml. 180 $\mu$ l of these infected cells was transferred to wells of the 96 well plate containing the compounds.
- 25 4) The plate was incubated in a CO<sub>2</sub> incubator at 37°C for 4 days. The cell survival rates were measured following the manufacturer's recommendations (CellTiter 96<sup>®</sup> AQ<sub>ueous</sub> Non-Radioactive Assay - Promega (cat no: G5430)). The concentration at which the compound inhibited the cytotoxic effect of the virus by 50% was expressed as the EC<sub>50</sub>.

<sup>1</sup>H Nuclear magnetic resonance (NMR) spectra were in all cases consistent with the proposed structures. Characteristic chemical shifts ( $\delta$ ) are given in parts-per-million downfield from tetramethylsilane using conventional abbreviations for designation of major peaks: e.g. s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br, broad. The following abbreviations have been used: HRMS, high resolution mass spectrometry; hplc, high performance liquid chromatography; nOe, nuclear Overhauser effect; m.p., melting point; h, hour; Et, ethyl; CDCl<sub>3</sub>, deuteriochloroform; D<sub>6</sub>-DMSO, deuteriodimethylsulphoxide; CD<sub>3</sub>OD, deuteromethanol; THF, tetrahydrofuran. '0.880 Ammonia solution' means a concentrated aqueous solution of ammonia having a specific gravity of 0.88. Where thin layer chromatography (TLC) has been used it refers to silica gel TLC using silica gel 60 F<sub>254</sub> plates, R<sub>f</sub> is the distance travelled by a compound divided by the distance travelled by the solvent front on a TLC plate. In certain of the Examples there is the possibility of regioisomerism in the product. The structures of certain Examples, for instance Examples 7 and 13 have been proven by nOe experiments. The regiochemistry of other Examples has been assigned by comparing characteristic shifts in their NMR spectra with the corresponding shifts in the NMR spectra of Examples 7 and 13.

EXAMPLES 7 and 8

Ethyl [4-(3,5-dichlorobenzyl)-3-isopropyl-5-methyl-1*H*-pyrazol-1-yl]acetate (Example 7)

5       Method A:

A solution of 21% weight/volume sodium ethoxide in ethanol (227 $\mu$ L, 0.7mmol) was added dropwise to a stirred solution of the pyrazole of Example 17 (172.7mg, 0.61mmol) in dry ethanol (1ml) at room temperature in a Reacti-vial (Trade Mark) (a sealable reaction vessel; available from Pierce & Warriner (UK) Ltd). Ethyl bromoacetate (136 $\mu$ L, 1.22mmol) was added and the Reacti-vial (Trade Mark) was sealed and heated at 80°C for 2 hours and then stirred at room temperature for 16 hours. Further sodium ethoxide in ethanol (227 $\mu$ L, 0.7mmol) and ethyl bromoacetate (136 $\mu$ L, 1.22mmol) were added and the sealed mixture was heated for a further 7 hours. After cooling to room temperature further sodium ethoxide in ethanol (227 $\mu$ L, 0.7mmol) and ethyl bromoacetate (136 $\mu$ L, 1.22mmol) were added and the sealed mixture was heated for a further 10 hours. After cooling to room temperature the mixture was concentrated under reduced pressure and the residue was partitioned between water (30ml) and dichloromethane (30ml) and the aqueous layer was further extracted with dichloromethane (2x30ml). The combined organic layers were dried over magnesium sulphate and concentrated under reduced pressure and the crude product (321mg) was purified by flash chromatography on silica gel eluting with pentane:ethyl acetate (7:1, by volume) to provide Example 7 (175.3mg) as a white solid, m.p. 90-92°C.

Method B:

A solution of the  $\beta$ -diketone of Preparation 1 (245mg, 0.85mmol), ethyl hydrazinoacetate hydrochloride (132mg, 0.85mmol) and triethylamine (131 $\mu$ L, 0.94mmol) in

ethanol (1ml) was stirred and heated in a sealed Reacti-vial (Trade Mark) at 80°C for 24 hours. After cooling the mixture was concentrated under reduced pressure and the residue purified by flash chromatography on silica gel eluting with a solvent gradient of pentane:ethyl acetate (10:1, by volume) then pentane:ethyl acetate (5:1, by volume) to provide Example 7 5 (28.6mg) as a white solid, m.p. 94-95°C.

Further elution of the column afforded ethyl [4-(3,5-dichlorobenzyl)-5-isopropyl-3-methyl-1*H*-pyrazol-1-yl]acetate (Example 8) (228.8mg) as a yellow oil.

10 <sup>1</sup>H-NMR (400MHz, CDCl<sub>3</sub>): δ = 1.19 (d, 6H), 1.28 (t, 3H), 2.06 (s, 3H), 2.92 (heptet, 1H), 3.82 (s, 2H), 4.23 (q, 2H), 4.86 (s, 2H), 6.96 (s, 2H), 7.17 (s, 1H). This structure was confirmed by nOe experiments.

4-(3,5-Dichlorobenzyl)-3,5-diethyl-1*H*-pyrazole

Hydrazine hydrate (187  $\mu$ L, 3.85mmol) was added to a stirred solution of the  $\beta$ -diketone of Preparation 5 (1.00g, 3.5mmol) in ethanol (2.5ml) in a Reacti-vial (Trade Mark) at room temperature. The Reacti-vial (Trade Mark) was sealed and the mixture heated at 100°C for 3 hours. After cooling to room temperature the mixture was concentrated under reduced pressure to leave an oily white solid (1g) which was purified by flash chromatography on silica gel eluting with dichlormethane:methanol (98:2, by volume) to give the crude product which was recrystallised from diisopropylether (10ml) to give the title compound (150mg) as a white solid. LCMS analysis revealed a small amount (ca.10%) of monodechlorinated impurity carried through of Preparation 5. This impurity could be removed by hplc (150x21.2mm Phenomenonex Luna C<sub>18</sub> 5 micron column, solvent gradient 0.1%, by volume aqueous diethylamine:methanol (90:10, by volume) to 0.1%, by volume aqueous diethylamine:methanol (10:90, by volume)) to afford pure title compound.

EXAMPLE 12

2-[4-(3,5-Dichlorobenzyl)-3,5-dimethyl-1*H*-pyrazol-1-yl]ethanol

To a stirred suspension of the diketone of Preparation 4 (302mg, 1.17mmol) in ethanol (1ml) was added 2-hydroxyethyl hydrazine (81 $\mu$ L, 1.29mmol) and the resulting mixture was heated at 100°C in a sealed Reacti-vial (Trade Mark) for 6 hours. After cooling, the mixture was concentrated under reduced pressure and the residue was purified by flash chromatography on silica gel eluting with a solvent gradient of pentane:ethyl acetate (1:2, by volume) then pentane:ethyl acetate (1:5, by volume) to afford the title compound (351mg) as a white powder.

15 LCMS analysis revealed a small amount (<10%) of dechlorinated impurities presumably arising from the reduction step in Preparation 4 but not detected at that stage. A portion of the product (190mg) was recrystallised from ethanol:water (2:1, by volume) (3ml) to afford a white solid (150mg). LCMS analysis then revealed only a trace amount (<5%) of mono-chlorinated product. This over reduction could probably be avoided by using the alternative reduction procedure of Preparation 6.
